

OPA Transmission Availability Table for Small FIT 2012

The transmission availability table has been developed to provide a general indication of the electricity system's ability to accommodate new renewable generation projects in the FIT Program. The table indicates general availability on transformer stations. FIT applicants should talk to the local distribution company where the proposed project will be connected to determine the availability of distribution system infrastructure (such as feeder capability) to connect their specific project. The values shown in the table are intended only to provide general guidance to applicants. Generation capacities exceeding the levels indicated in the table can sometimes be accommodated once projects are assessed using the transmission availability test. Other technical factors may also be found during this test that restricts the amount of generation that can be connected. The values are based on information available at the time this table was prepared. Updated information will be used when applications are reviewed under the FIT Program transmission availability test and distribution availability test.

The information provided in the table is intended as a guide to facilitate the planning of projects by applicants to the FIT Program, and to assist applicants in their discussions with transmitters and local distribution companies and in completing the FIT application form. The information provided in the transmission availability table is a result of collaborative efforts by the Independent Electricity System Operator, transmitters, local distribution companies and the OPA. Although the information has been developed with the best information available at the time, the possibility of errors exists. The OPA and its directors, officers, employees, advisors, and agents, as the case may be, and the Independent Electricity System Operator, transmitters and the local distribution companies, assume no responsibility whatsoever, and expressly disclaim any liability, for the information provided. Applicants are reminded that the transmission availability test is the actual test that will be carried out under the FIT Program and as such is the only process that determines the acceptability for connection of new generation under the FIT Program. Further, there are other assessments, such as the connection assessments and approvals process of the local distribution company (also known as the Connection Impact Assessment), pursuant to which the applicant must obtain approvals that could deny connection of new generation projects.
